RESEARCH INTERESTS

Automatic speech recognition (ASR) with focus on weighted finite-state transducers (WFST), novel inference architecture (Decoder) and discriminative training.
End-to-end System, Language Model, Keyword Spotting, Robust ASR, Speech Synthesis.

EDUCATION

2014 - present, Ph.D. Candidate, Computer Science, Shanghai Jiao Tong University.
Supervised by Prof. Kai Yu (<http://speechlab.sjtu.edu.cn/~kyu/>).
2010 - 2014, B.E., Electronics and Information Engineering, Huazhong University of Science and Technology.

RESEARCH EXPERIENCES

Robust ASR Research Internship (MSR, Redmond) 2017.5 - 2017.7

Research internship in *speech and dialog research group*, Microsoft Research, Redmond, supervised by Jasha Droppo (<https://www.microsoft.com/en-us/research/people/jdroppo/>).

Significantly advancing the state-of-the-art unsupervised single-channel overlapped speech recognition system and submitting a transaction on this topic.

Speech Recognition End-to-end ASR and Decoding Framework 2014.8 - present

1. On joint training of acoustic model, lexicon and language model to replace the WFST based beam search in ASR.
2. Inference framework in CTC. The proposed PSD framework achieves **5** times speedup versus traditional CTC-based system and **30** times speedup versus HMM-based system. The framework can be extended to LF-MMI.
3. Confidence measure in CTC. The proposed confidence measure achieves significant improvement versus the traditional method in both CTC and HMM trained models.
4. Sequence discriminative training in keyword spotting (KWS). Solve the search space modeling problem in KWS. Sequence discriminative training in both HMM and CTC framework achieves significant improvement.
5. LSTM language modeling and lattice rescoring. Speed up the lattice rescoring significantly. The improvement includes model inference, history clustering and stream parallelization.
6. Human-directed ASR errors are collected from confusion network. BLSTM language model is trained to estimate sentence completion scores, combined with the confusion network scores to do correction.
7. Implement On-the-fly Rescore WFST decoding method and compare it with traditional 2-pass rescore WFST decoder.
8. Design a parametric model, which can be inferenced with offline decoding records of the whole process, to tune beam dynamically by features in decoding process so as to thoroughly speedup.
9. Improve lattice quality in WFST Decoder by efficient time realignment. By this way, Confidence measure and ASR result from Confusion Network(CN) can both be improved.

Speech Synthesis Speech Synthesis using HMM & DNN 2014.3-2014.7

Develop HMM & DNN Speech Synthesis systems and analyze the performance gap between them.

AWARDS AND ACTIVITIES

2017, Microsoft Research Internship (mentor: Jasha Droppo).

2017, ICASSP 2017 student travel grant.

2016, Interspeech 2016 student travel grant.

2013, Microsoft Young Fellows Scholarship. (Asia, total 36 undergraduates)

2013, Excellent Student (University, top 2%)

2013, the National Undergraduate Electronic Design Contest (National, Second Prize)

2013, Challenge Cup (Province, First Prize)
